DEVELOP A WEB APPLICATION USING NODE RED SERVICE

TEAM ID:PNT2022TMID41407

Junctions do not appear as regular nodes in the palette or flow outline, but can be added through the quick-add dialog (Ctrl-click in the workspace) or the new Context Menu.

You can also insert a Junction into an existing wire by slicing through it with the mouse by holding `alt-shift` when dragging across the wire. Note that some OS might use that same combination to move the active window, so this won't work there. We don't yet have a way to

sidebar:

Runtime Features

With this release you can now use `msg.target` to set the name of the Link In node it should call.

Environment Variables in the Template node

The Template node can now access environment variables using the syntax:

```
My favourite colour is {{env.COLOUR}}.
```

Debug node message count

The Debug node has a new option to report how many messages it has received in its status output.

Predefined HTTP Request headers

The HTTP Request node now allows you to set request headers in the node's edit dialog - rather than having to always pass them in as message properties.

What's next?

As happened with 2.0, we've overrun our plan for getting 3.0 released in April. But the series of beta releases we have been doing have really helped improve the overall quality of this
